

User Persona 01 — Yemi

Debut Marathon Runner · 27 · Job Seeker

"I want a structured training plan, but real life doesn't always go according to schedule."

Profile

Yemi is preparing for her first marathon while also training for several half marathons and looking for a job in Jakarta. She follows a self-guided training plan without a coach or paid subscription.

Goals

- Complete her first marathon
- Follow a structured training plan
- Stay on track even when her schedule changes

Pain Points

- Struggles to create and organize her own training schedule
- Finds it difficult to adjust the plan when other events come up
- Training can be disrupted by unexpected situations such as illness or lack of motivation

Needs

- Reliable workout tracking
- Automatic suggestions when a workout needs to be skipped or rescheduled
- An easy-to-adjust training schedule
- Useful features that provide value without an expensive subscription

Motivation

Structure + Flexibility She wants clear direction throughout her training while still having the flexibility to adapt when unexpected situations happen.

Price Sensitivity

Prefers useful features that remain accessible without requiring an expensive subscription.

User Persona 02 — Experienced Runner

Composite Persona · Experienced Runner · Working Professional

"Running is important, but when work gets in the way, work comes first."

Profile

An experienced runner who runs regularly while managing a demanding work schedule. Has tried multiple smartwatches (Garmin, Amazfit, Xiaomi) before settling on COROS for basic workout tracking.

Goals

- Maintain consistency in training
- Keep running regularly despite a busy work schedule
- Find practical compromises when work conflicts with training

Pain Points

- Struggles to maintain the training schedule when work takes priority
- Work commitments can disrupt planned workouts
- Sometimes replaces a running session with strength training as a compromise

Current Behavior

 Has tried multiple smartwatches (Garmin, Amazfit, Xiaomi) before settling on COROS — currently uses it for basic workout tracking.

Needs

- More value than basic workout tracking
- Support for maintaining training consistency
- Flexibility when work conflicts with scheduled workouts

Frustrations

Additional features, such as strength tracking, may not feel valuable when they are rarely used.

Device Preference

App ↔ Smartwatch Runners may already have their preferred tracking device, so the product should not assume that every user needs all tracking functionality within the app.

After trying several smartwatch brands, this runner settled on COROS specifically for its comprehensive features, app design, and reliable data accuracy — showing that experienced runners are selective and comparison-driven, not just brand-loyal.

Motivation

Consistency over intensity — wants running to fit around life, not compete with it.

Key Insight

The two personas highlight a shared underlying need: runners don't only need to track what they did — they need help adapting their training when real life gets in the way.

Yemi needs flexibility because of unexpected life events, while the experienced runner needs flexibility because of work commitments.

Additionally, experienced runners have often already tested multiple tools before finding one that fits — meaning a new training app isn't just competing on features, but on trust in data accuracy and interface quality.

That gives the product a clear UX direction:

Training Plan → Real-life disruption → Adaptive recommendation → Keep training on track
